*****EXPLANATORY NOTES *****

BIRTH DATES Birth dates are approximate and could be out by a couple of weeks either way. We don't mother up calves every day. Calves are born from late August through until about the end of December.

* **MORPHOLOGY.** Some bulls have tested a bit lower in normal morphology on the day. (Numbers in blue) This is common and usually transient in young bulls and will most likely improve on maturity. All bulls are backed by our usual vendor guarantee.

** **HornPoll - PP** - This animal possesses two copies of the poll variant of the gene. This animal is highly likely to express a polled phenotype and highly likely to pass a poll variant to its progeny.

** **HornPoll - PH** - This animal carries one copy of the poll variant and one copy of the horn variant of the gene. This animal is highly likely to express a polled or scurred phenotype and will transmit either the horn or poll variant to its progeny.

** **HornPoll - I** - (Indetermined). If the bull is polled it is highly likely that he is PP. If the bull is scurred - he could be PP or PH. If the bull is horned then he is highly likely to be HH. However, there is a degree of error in the testing.

** **HornPoll - HH** - This animal carries two copies of the horn variant of the gene. This animal is highly likely to be horned and will always transmit the horn variant to its progeny.

*** **WEIGHT.** Bulls have been fed a Bull Ration in self-feeders in the paddock.

VIBRIO VACCINATION - Bulls are due for their next Vibrio shot in **April 2023.**
